

QWATT turns measured renewable energy into verifiable on-chain records - and sells the solar installations that generate them.

THE PROBLEM

Green energy has a proof gap: claims are cheap, certificates arrive months late, and double counting is structural. The evidence - meter data - is generated every second and dies inside private systems. Chilean power bills rose over 50% since 2024 with increases scheduled to 2035; blackouts turned batteries into insurance. Demand for solar is surging. Trust in green claims is not.

THE FULL STACK - GENERATION TO SALE

One team covers the whole chain: hardware we install, industrial SCADA software we already build for critical infrastructure, and a settlement layer on Stellar. Install it, operate it, verify it, monetize it. (QWATT-Quorelia SCADA integration: in design.)

WHAT WE BUILT (WORKING TODAY)

- qwatt.org - live dashboard on the real EPEX power market (24H to 5Y)
- Real asset on Stellar testnet: 42.7M QWATT, atomic purchases
- Proof-of-Generation mining: 0.001 QWATT per verified kWh, price attested in every memo
- Public Explorer (/proof): per-event evidence chains, read live from Horizon
- WattNode v1 spec: dual metering, sun witness, two-party minting - a compromised node is a broken sensor, not a money printer
- Honest status labels everywhere: TESTNET / PROTOTYPE / PLANNED / DEMO

SOUND BY DESIGN

Vintage-pricing invariant: a QWATT is valued at the price attested at its origin event, never at current spot. Solar mints cheap at noon - spot redemption at night would drain any treasury. Time-shifting belongs to batteries, not token rules.

BUSINESS MODEL - A FLYWHEEL, NOT A TOKEN SALE

Layer 1 (revenue now): solar installation in Chile. Solar Base (25-30% margin), Solar + Respaldo (hybrid + battery, the margin engine), Solar Negocio (SME, 3.5-4 yr payback). Year-1 plan: 30 installs, ~CLP 41M gross margin.

Layer 2 (the moat): the protocol. Monitoring SaaS, verified generation records, and QWATT-C - one clean attribute per verified MWh, burned on claim so a green MWh can never be counted twice.

The flywheel: installs fund the protocol; the protocol differentiates the installs; every verified roof grows the attribute base.

WHY STELLAR

~5 s settlement - \$0.00001 fees - native assets - memos as attestations. SCF path in preparation (Tranche 0 legal, Tranche 2: 10-20 prosumers with real meters). First pilot specified: hybrid 4.4 kWp + storage, Lo Barnechea, Chile.

TEAM

Jay & Diego - co-founders. Shared roles across the whole company: both engineer, both design, both sell, both build the protocol. From a Stellar x AI Studio Build Challenge project to this platform in under two weeks, in public.

DON'T TRUST IT - VERIFY IT

qwatt.org · qwatt.org/proof · qwatt.org/whitepaper.html · github.com/academiaseul/QWATT

Everything runs on Stellar testnet. Nothing in this document is an offer of securities or investment advice; QWATT is not for sale. QWATT-C is planned architecture - a voluntary transparency instrument, not a REC or carbon credit unless expressly homologated. Legal review precedes any mainnet or commercial step.
